8. Statistics, chest counter, and optional extras	.....
Quick checklist before the first real run	.....
Common issues — what to try	.....

This guide walks you through **initial setup** in order. Follow the steps below one by one.

**Important:** Use TotalCrypter only in ways allowed for your game, server, and account.

**Version:** TotalCrypter **v5.1.0** — the sidebar is grouped into **Tools** (Autocrypter, Chest counter, Epic Attack, Timers & macros) and **Others** (Telegram, Support, Statistics). The screenshots in this guide match that layout.

## What you need first

- TotalCrypter installed.
- Your game (or app) running **the same way you usually play**—same screen size, same zoom in the browser or client. If any of that changes later, you usually need to **run setup again**.

## 1. Open the app and your account

1. Start TotalCrypter.
2. At the **bottom of the dark sidebar** you see **tokens** and whether you are **logged in**.
3. Tap **Login** (orange). If you do not have an account yet, use **Create account**, then log in.
4. At the top of the workspace, an optional **context strip** may show profile, login, and run status when enabled.

General settings

General settings  
Guided setup scope: Full wizard (all calibration items)

Timing and boost

- Pause between crypt list rows (seconds): 1.50
- Wait after opening list via watchtower (seconds): 0.55
- Wait after switching to crypt list tab (seconds): 0.45
- Wait for list to settle after scrolling (seconds): 0.85
- Maximum wait for crypt popup: 5.50

Status: •  
Autocrypter & Epic: 1.80 tokens/min ·  
Chest, macro & timers: free

v5.1.0

Sidebar: account and navigation

Note: Some features (for example the main bot) only work fully when you are logged in.

## 2. Language and the guided setup

1. Under **Tools** in the sidebar, click **Autocrypter** (first entry).
2. At the top of the workspace, open the **General settings** tab.
3. Choose the **Simple** sub-tab (not Expert if you are new).
4. Set **Screen language** to your preference (English, German, etc.).
5. For **Guided setup scope**, your **first setup** works best with the option that includes **all** steps (full wizard).
6. Click **Save**.

General settings: language and guided scope

### 3. Create your own profile

A **profile** is a saved bundle of settings for **your** screen and **your** layout.

1. Stay on **Autocrypter** and switch to the **Calibration** tab at the top.
2. In the calibration hub, open the **Profiles** sub-tab.

3. Tap **New empty profile** (or **New empty**).
4. In the dialog, choose: - **Yes, use standard** — copies image templates and colors from the standard profile ( `default` ); the setup assistant then focuses on **coordinates and regions**. Faster on a typical layout. - **No, capture all** — same as before: the assistant walks through **every** step including images and colors.
5. Under **Name for this profile**, enter a clear name (for example “My screen – May 2026”).
6. Tap **Save**.
7. Your profile should show as **active** in the list.

The screenshot displays the 'Autocrypter' control panel within the TotalCrypter application. The interface is divided into a dark sidebar on the left and a main content area on the right.

**Sidebar (Left):**

- TOOLS:** Autocrypter (selected), Chestcounter (Free), Epic Attack (BETA), Timers & ma... (Free).
- OTHERS:** Telegram, Support, Statistics.
- Status:** Autocrypter & Epic: 1.80 tokens/min · Chest, macro & timers: free.
- Buttons:** Login, Register, Forgot password.
- Language:** DE, EN.
- Version:** v5.1.0.

**Main Content Area (Right):**

- Header:** Autocrypter, with icons for settings, calendar, BETA, and clock.
- Active:** new3, Not logged in.
- Control Panel:**
  - CRYPT:** Crypt type: Epic; Level: 35.
  - STOP:** Crypts: 0; Minutes: 0.
  - Buttons:** Start (Play), Stop (Square).
- Settings:** General settings, Calibration (selected).
- Profiles:** Profiles, Setup, Edit.
- Instructions:** Use the wizard for required fields; the list below for fine-tuning and switching profiles.
- Profile management:** New empty, Save, Change profile.
- Profile configuration:**
  - Name for this profile:** new3
  - Profile file (advanced):** esktop\p\user\_data\profiles\new3.json
- Profile list:**
  - new3:** default.json | 2026-05-20 20:09 (Change, Delete)
  - new1\_20260511\_223609\_20260511\_224451:** new1\_20260511\_223609\_20260511\_224451.json | 2026-05-13 16:15 (Change, Delete)
  - new2:** new2.json | 2026-05-13 20:08 (Change, Delete)
  - new3 active:** new3.json | 2026-05-20 20:09 (Change, Delete)

Create and activate a profile

*Tip:* For a different PC, resolution, or zoom level, create a **new profile** instead of reusing an old one.

## 4. Setup—where the program “learns” your screen

Here you show the software **where** to click and **what** to look for on **your** window.

1. **Autocrypter** → **Calibration** tab → **Setup** sub-tab.
2. Read the short text at the top (it reminds you that you chose the scope under *General settings* in step 2).
3. Press the large orange **Start assistant** button.
4. Follow the **numbered steps** in the middle: - **Monitor**: Which display is used (as shown in the app). - **Profile**: That your profile is loaded. - **Finish the required items** until the counters show everything is done. - **Template images**: That every required small picture is found (many are already set if you chose **use standard**). - **Check of all settings**: There must be **no errors** before you run for real. Warnings should be read and fixed if the app expects it. - **Ready to start**: Only after a clean check.

Other useful buttons here:

- **Validate setup** — checks that the setup hangs together.
- **Setup quick test** — short test when offered.
- **Check settings** — overall check, similar to step 5.

The screenshot displays the TotalCrypter Autocrypter interface. On the left is a dark sidebar with navigation options: TOOLS (Autocrypter, Chestcounter, Epic Attack, Timers & ma...) and OTHERS (Telegram, Support, Statistics). The main area is titled 'Autocrypter' and shows 'Active: new3' and 'Not logged in'. A control panel at the top allows setting 'CRYPT' type to 'Epic', 'Level' to 35, 'STOP Crypts' to 0, and 'Minutes' to 0, with 'Start' and 'Stop' buttons. Below this are tabs for 'General settings' and 'Calibration', and sub-tabs for 'Profiles', 'Setup', and 'Edit'. The 'Guided setup' section includes buttons for 'New empty profile', 'Start assistant', 'Undo last guided capture', 'Setup quick test', 'Validate setup', and 'Check settings'. A progress list shows: 1. Select screenshot monitor (1/1: 1920x1200 at 0,0 Windows reports ~96 DPI (96 = 100 %). With scaling the browser viewport often looks smaller — capture coordinates on the visible game area.); 2. Load or create profile (Active profile: new3); 3. Calibrate required variables (58/58 required guided setup items completed.); 4. Verify template images (13 required template images found.); 5. Run check of all settings (Check of all settings: pending); 6. Start TotalCrypter (Ready to start after an error-free settings check.). The bottom left sidebar shows 'Status: • Autocrypter & Epic: 1.80 tokens/min · Chest, macro & timers: free', login/register buttons, language selection (DE/EN), and version v5.1.0.

*Calibration: steps and assistant*

## How captures work (short)

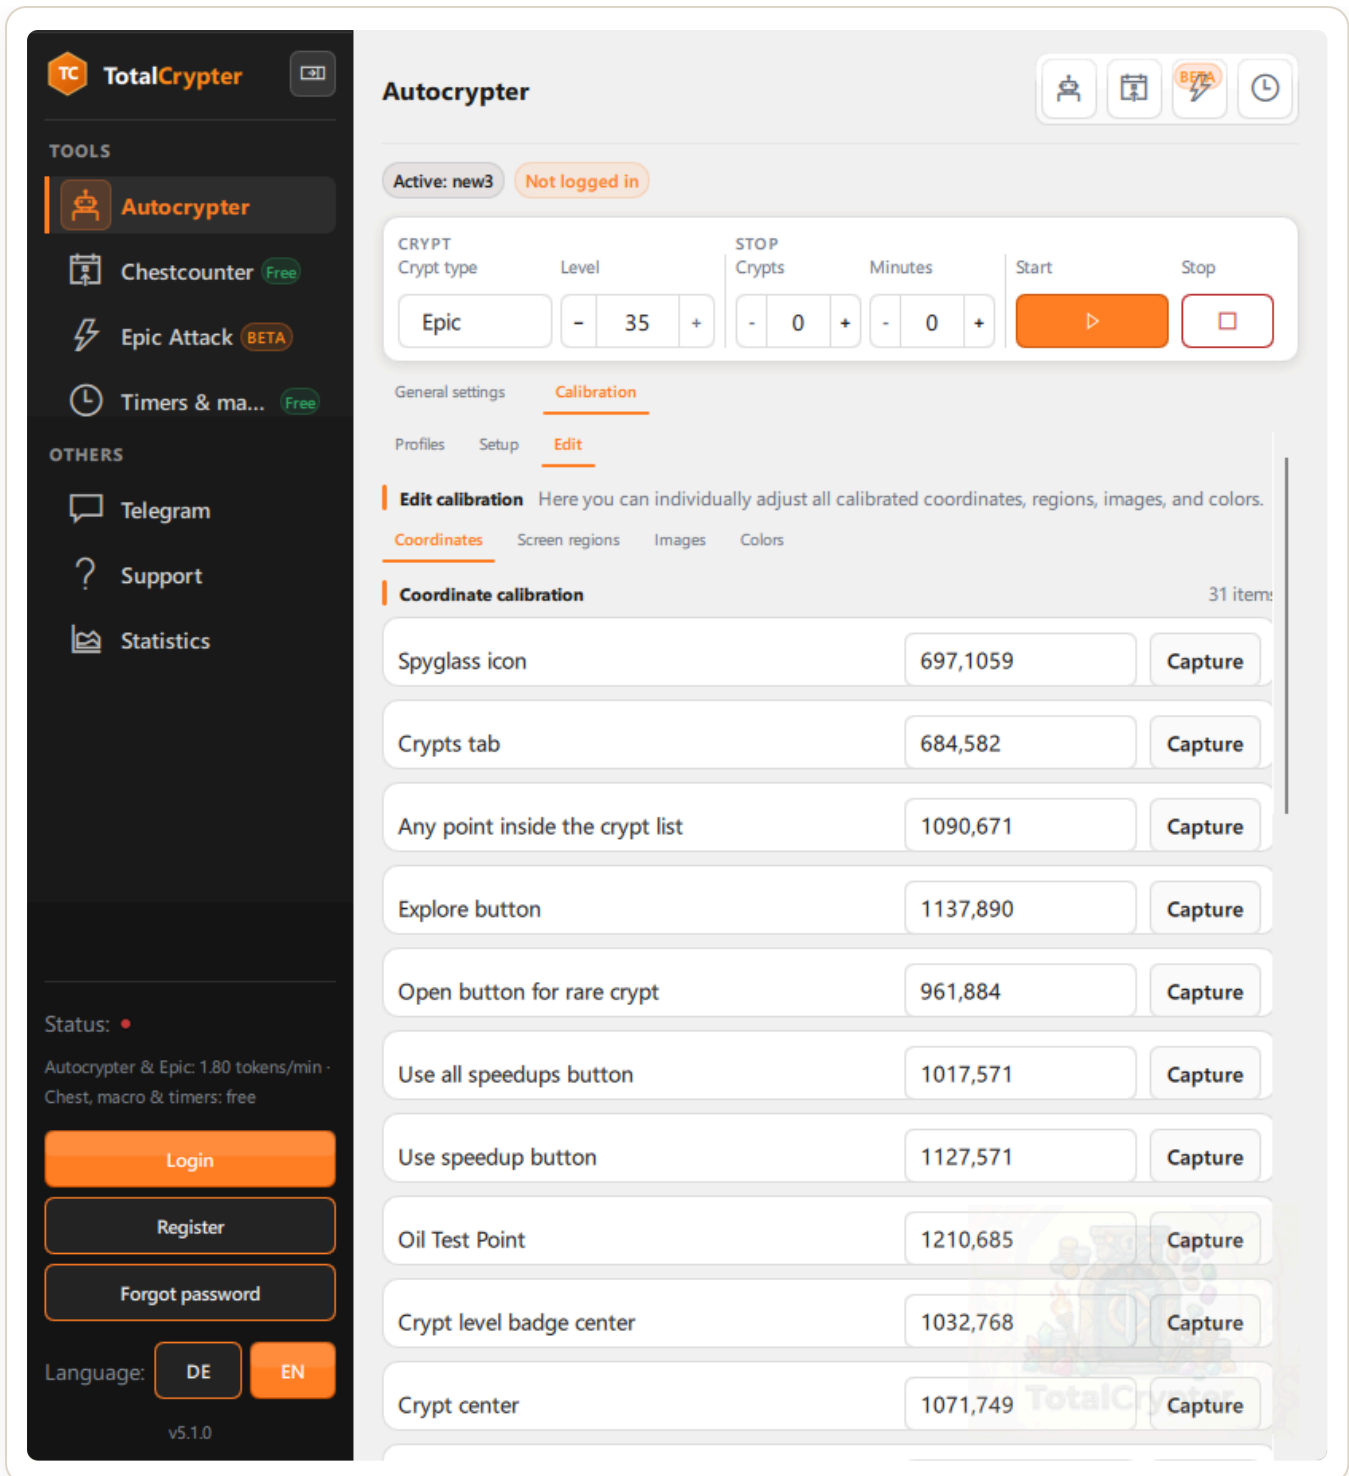

- When the assistant asks for a **spot**: move the mouse **exactly** onto the named thing in the game and confirm as told—often with **Enter**, and **no mouse click** when the instructions say so (so the game state does not change).
- If something is **not on screen** right now: use **Skip** and come back later.
- For **areas**: usually one corner, then the other, as shown.
- For **small pictures**: only sharp crops that really match what you see in play.

---

## 5. Fine-tuning (only if needed)

If the check still complains or something is “almost right”:

1. **Autocrypter** → **Calibration** → **Edit** sub-tab.
2. You will see tabs such as **Coordinates**, **Screen regions**, **Images**, and **Colors**.
3. Use **Capture** to retake a value.

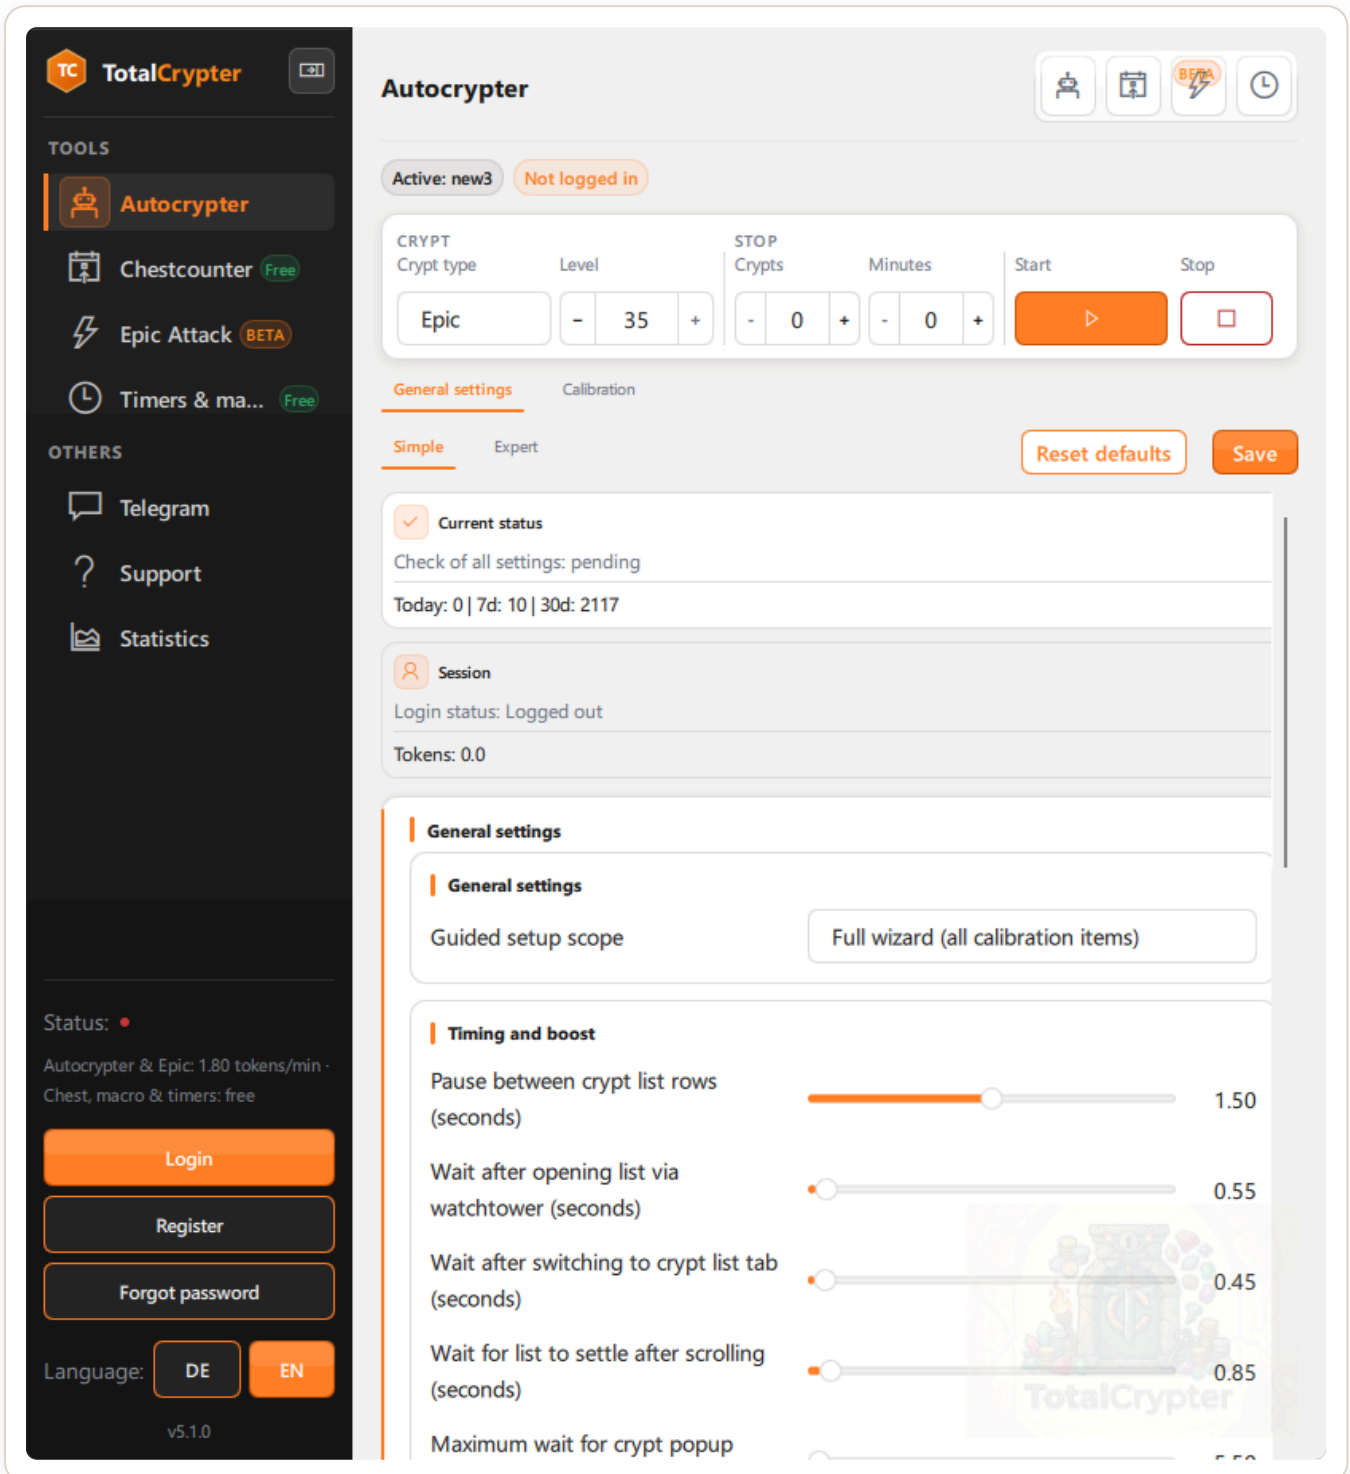

*Edit calibration*

## 6. Before you run: Autocrypter and checks

1. Click **Autocrypter** in the sidebar if you were elsewhere.
2. Open the **General settings** tab for **Crypt type**, **Level**, and optional stop limits.

- In the **sticky action bar** at the top, press **System check** if you are unsure—the check should show **no errors**.
- Optional: **Stop (crypts)** or **Stop (min)** to stop after a count or after minutes. Leave blank if you will stop manually.
- In the sidebar footer or context strip: **Tokens** and cost per minute. Use **Buy tokens** if you need more.
- Only when the check is clean: **Start automation** (or **Start**) in the action bar.

Autocrypter: controls and status

**Safety:** The **Space** key stops automation anytime.

### Optional mini tool windows

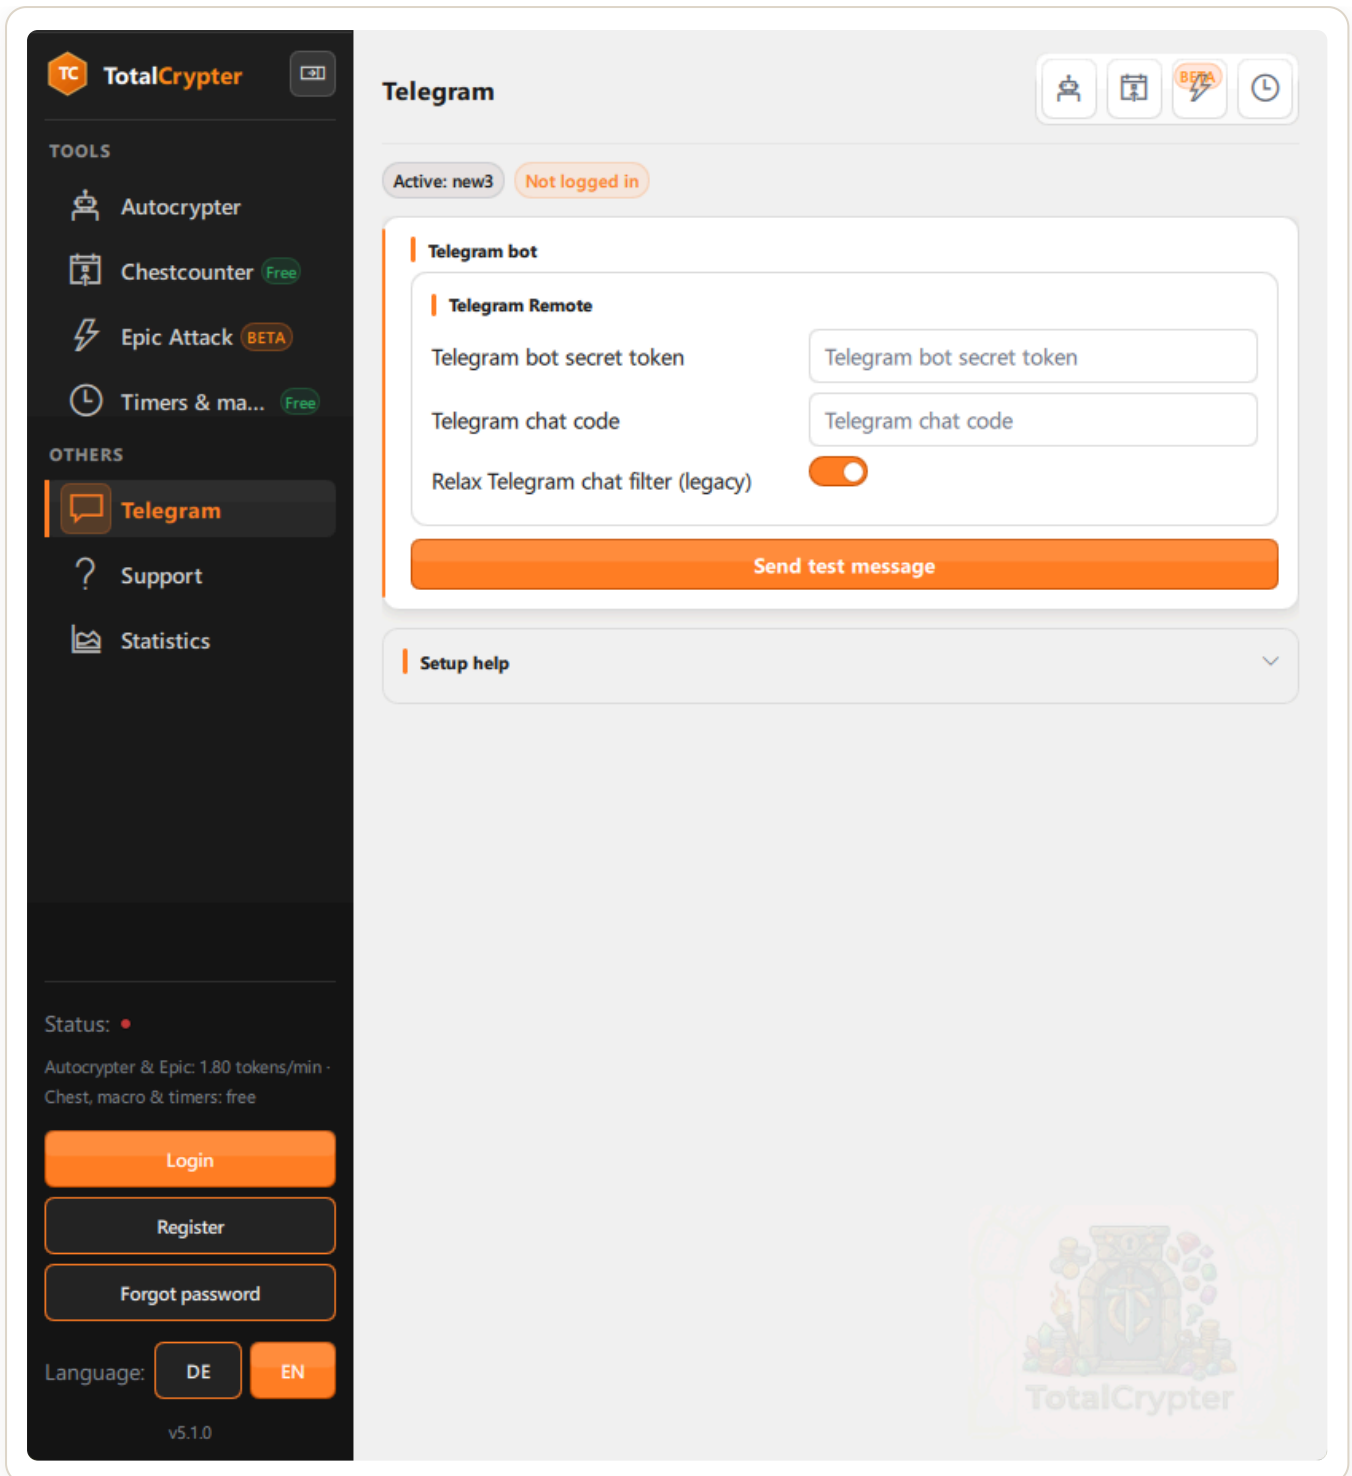

On the right side of the top action bar, small **icon buttons** open a **separate window** for Autocrypter, chest counter, Epic Attack, or timers & macros—with start/stop and core fields. Useful when the main window stays in the background. You can enable **always on top** in each mini window. This replaces the old in-main-window **compact bar** / “mini panel” (hidden by default from 5.1.0 onward).

You can **collapse** the sidebar to a narrow icon rail with the arrow at the top and expand it again.

---

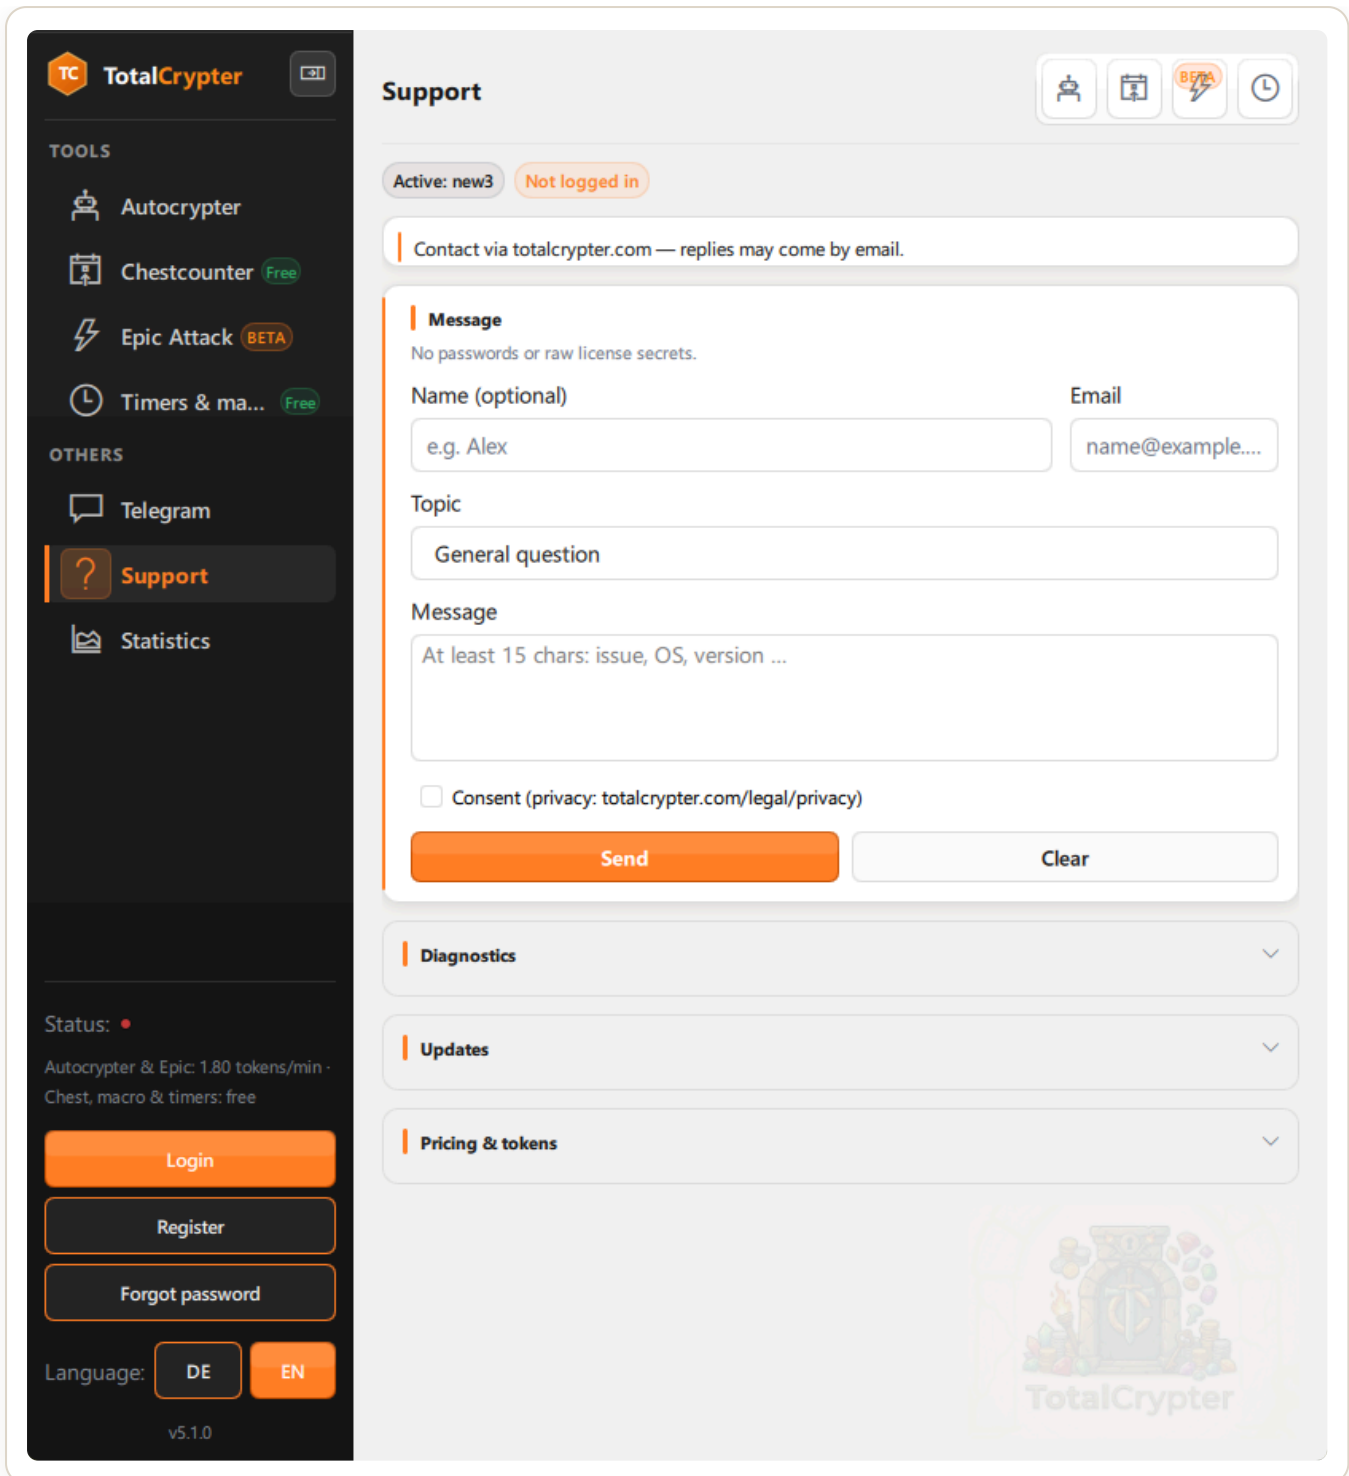

## 7. Telegram and Support (optional)

**Telegram** (under **Others** in the sidebar): Only if you want remote messages. Enter the bot token and chat ID, then use **Test message**. **Do not share** these with anyone—they work like keys to your setup.

Telegram settings

**Support** (under **Others**): Short message to support. Long sections (**Diagnostics, Updates**) fold open and closed with the accordion (▼/▶).

Support page

## 8. Statistics, chest counter, and optional extras

- **Statistics** (under **Others**): Summaries appear after you have runs. At first you may see “no sessions yet”—that is normal. The **History** section can be collapsed.

**Statistics**

v5.1.0

### Statistics

- **Chest counter** (under **Tools**): Separate tool—after login, complete the **two calibrate** steps on that page, then use **Start / Stop** and watch the log (light background). **No** token use.

Chest counter

- **Timers & macros** (under **Tools**): **Shield timers** and the **desktop macro recorder**—optional, no tokens. Use the macro only when you are comfortable with the main workflow.
- **Epic Attack (beta)** (under **Tools**): Optional loop that uses the **same login and token session** as automation when you start a run. **Do not** run it together with the main bot or chest counter—the app blocks overlapping mouse use. **Space** requests stop during a run; leaving the Epic page stops an active run. On first use you get a **blank** coordinate profile at

`user_data/epic_attack/epic_attack_profile.json` . When you **save** your Autocrypter profile, shared fields (e.g. purple boost, accelerate, region) can **sync into Epic** only while those Epic slots are still empty. Longer explanation: [Epic Attack \(beta\) guide](#).

---

## Quick checklist before the first real run

- Logged in; enough tokens for what you plan (Epic/Autocrypter only)
  - Profile **active** and saved (standard-templates choice made on purpose)
  - Guided setup **finished**; **check of all settings** shows **no errors**
  - Game open as usual; **same** zoom and layout as during setup
  - In-game view matches what the assistant required (certain icons visible—follow the app text)
  - Autocrypter** → pick type and level → **Start automation**
  - You know: **Space** = stop immediately
  - If you use **Epic Attack (beta)** or the **chest counter**: main automation **stopped** first; chest/macro/timers are free
-

## Common issues — what to try

Issue	What to try
"Calibration setup" / "Profiles" missing in the left menu	From 5.1.0: <b>Autocrypter</b> → <b>Calibration</b> tab → <b>Setup</b> / <b>Profiles</b> / <b>Edit</b> sub-tabs.
Check shows errors	<b>Calibration</b> → <b>Setup</b> or <b>Edit</b> , fix missing items, run <b>Check settings</b> again.
You changed zoom or monitor	New <b>profile</b> or run setup <b>again</b> for the new layout.
Chest counter does nothing	<b>Login</b> first, then both <b>Calibrate</b> steps on the chest counter page.
Epic Attack will not start	<b>Login</b> first; stop the <b>main bot</b> and <b>chest counter</b> ; see the <a href="#">Epic guide</a> .
Epic clicks are wrong	Calibrate on the Epic page, or <b>save</b> the Autocrypter profile (sync only fills empty Epic slots).
Clicks seem "off"	Do not guess—retake that spot with the <b>assistant</b> or <b>Capture</b> .

*Version note: TotalCrypter v5.1.0—on-screen labels may vary slightly in patch releases. If in doubt, trust the text in your installed app.*
